

Case Studies: **Emergency Response**

## Ironclad Provides Rapid Response in T-Oil Spill

In late summer of 2025, Ironclad's Baltimore team received a call at 7 p.m. A transformer had exploded on a job site in D.C., causing a major spill of T-Oil, a substance that is recordable in quantities as small as an ounce—so 250 gallons required urgent response to minimize contamination. **Frac tanks and roll-off boxes were needed – immediately.**

### The Challenge

With a job site located in D.C. and an evening forecasted with continuous rain, nothing about this emergency was simple. Getting tanks into a compact city environment is never easy, and the falling rain was carrying and spreading the T-Oil rapidly. The client knew getting tanks set up to help them manage a contaminated well was vital.

### The Response

Average industry response time for an emergency of this variety is four hours; Ironclad had the **first frac tank on-site within two hours.**

### The Outcome

Thanks to a coordinated effort between our Baltimore and Philadelphia branches, two frac tanks and two roll-offs were ultimately delivered for initial response. Ironclad also provided the client with:

- Delivery and set up of berms, fittings, and hoses to empower the client to remove contaminated water, should they choose to utilize a vacuum truck.
- The capability to provide waste hauling, when an approved and permitted TSDF is prepped for disposal.

## Assets Used

### Roll-Off Boxes

Store materials as you prepare them for safe transport; closed-top roll-offs are available.

### Frac Tanks

Store non-potable water and other liquids to maintain your on-site operations.

### Ancillary Products

Pumps, hoses, manifolds, berms and filtration tools create a holistic solution for your site.

"When we promise rapid response, we deliver. We know when spills happen, you have no time to waste."
